The process we followed to create our second database design was one that was not entirely difficult now that we have learned the processes to do so in a more advanced manner. I found this one to be much more interesting than the first assignment since we were tasked with populating the database ourselves, which was quite the interesting task to complete using generative AI. I was one of the people who attempted to fix the mess that ChatGPT had

generated, and I found it to be quite fun, sort of like a puzzle. Getting to the point we are at now compared to when we started these assignments, I am beginning to feel so comfortable with SQL that I would not be opposed to continuing a career in database security, something I had never considered before. I am excited to continue our assignments and pursue my professional life with the benefit of knowing the basics of SQL.
